How It Works: Listing Trees on Cloud Forest's Website

The Impact: Offsetting Emissions

Introducing Cloud Forest: Revolutionising the Future of Sustainable Business

Cloud Forest aims to revolutionise business sustainability by renting trees from farmers to combat deforestation, support local communities, and help companies achieve zero-emission goals.

Why this idea ?

Governments worldwide are imposing strict emissions regulations, like caps, carbon pricing, and reporting mandates. For instance, the EU's Green Deal targets carbon neutrality by 2050 and requires significant corporate emission cuts. Non-compliance results in fines, prompting businesses to set reduction goals and take action to avoid financial risks.

The Problem: Emissions from Companies and Deforestation

Rising emissions and deforestation drive 1°C global warming, fuelled by human-made greenhouse gases from industry, transport, and worsened by tree loss.

The Solution: Renting Trees from Farmers

The focus is on sustainable business practices benefiting both the environment and local communities. Companies rent trees from farmers to offset carbon emissions, ensuring a balanced carbon footprint, combating deforestation, and supporting local farming communities.

How It Works: Listing Trees on Cloud Forest's Website

Farmers list their trees on Cloud Forest's website for companies to rent and offset emissions. Companies select trees online, pay, and Cloud Forest handles tree care in collaboration with farmers.

The Impact: Offsetting Emissions

Our sustainable business approach, renting trees from farmers to offset emissions, yields a dual positive impact: reducing deforestation and supporting small-scale farmers. This leads to benefits such as decreased air pollution and boosted biodiversity, benefiting both human and wildlife populations.

Through our idea we are able to solve the UNSDGs
